TIO HUB

Manage service obligations with operational context

Connect contract terms, SLA case work, ownership and review in one operations workspace.

INTERNAL MARKETING DRAFT 2.1 | 24 OCT 2026

Fictional local data. Reference branding shown; external use requires brand approval.

Service reviews need evidence across four records

A service decision connects obligation, work and review.

Contract

Which signed terms, dates and scope apply?

SLA case

What target, event evidence and clock state apply?

ITSM work

Who owns response, next step, escalation and handover?

Finance review

What exposure needs independent reconciliation?

TIO Hub connects records; authorized owners decide contract interpretation and financial disposition.

Connected records support a clearer review

A connected operational workflow

The hub connects records entered by authorized users. It does not poll infrastructure or synchronize Jira.

Illustrative workflow; exact actions and access depend on configuration, role and deployed release.

Follow context

Start with the client and affected environment.

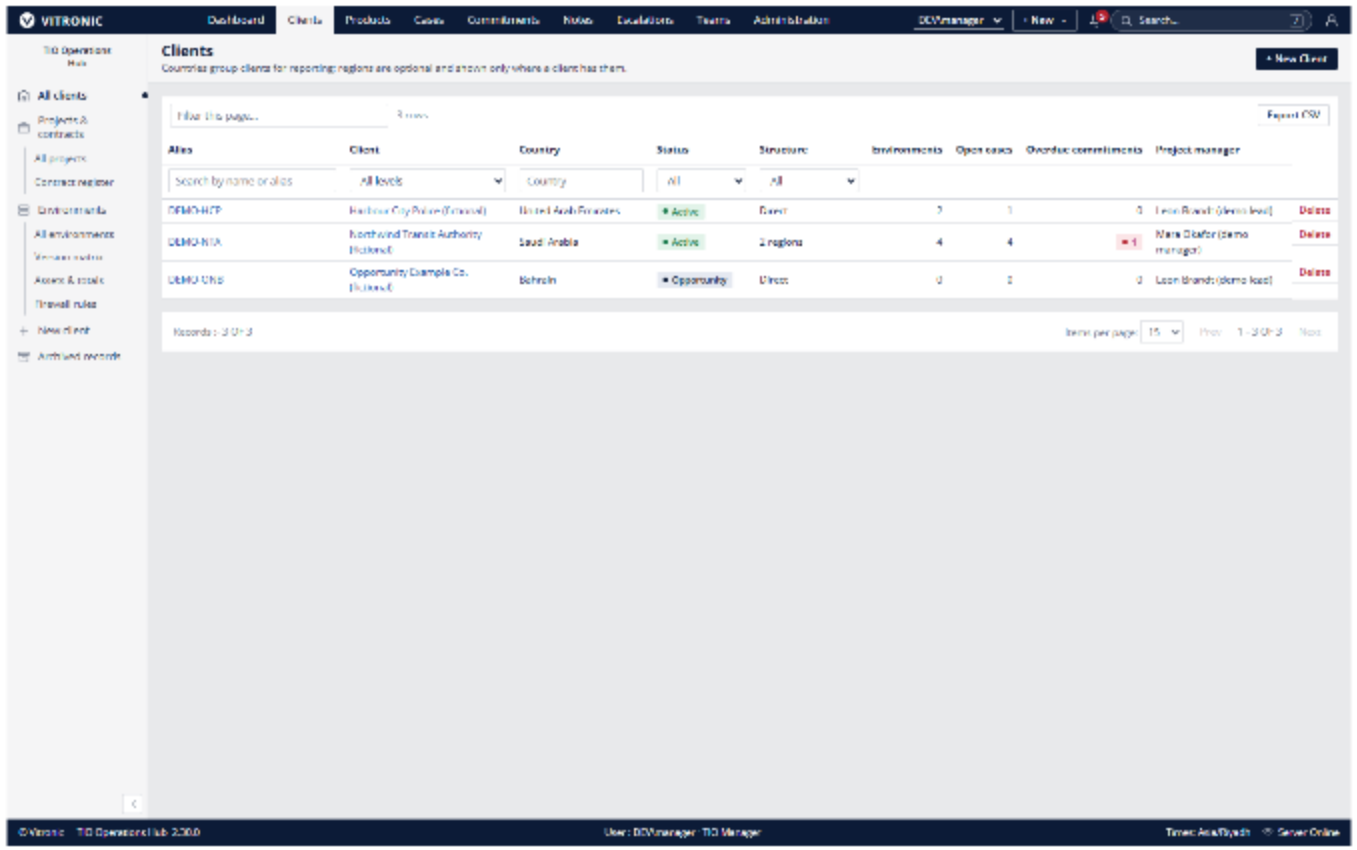

Assign the work

Review owner, next action and due time.

Review the record

Use history and reports to validate the picture.

Client and environment context

Keep related records together

Clients, projects and environments

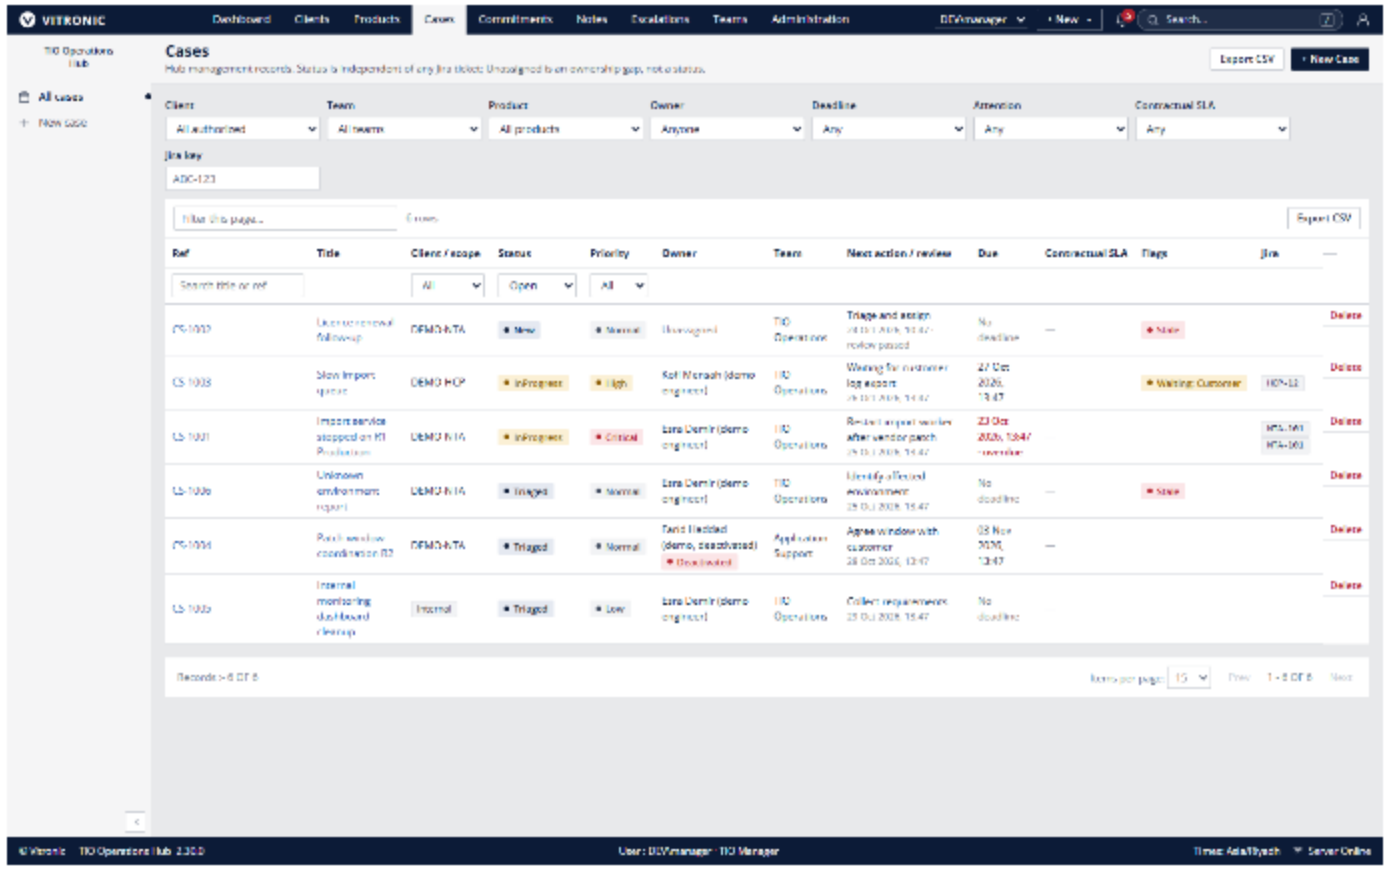

Products, versions and infrastructure

Reported condition with evidence date

Contacts and responsibility boundaries

Records are maintained by users; the system does not discover or monitor infrastructure.

Cases and commitments make work visible

Case context

Affected records
Owner and priority
Next action and due date
Status and event history
Manual Jira reference

Handover and coverage help teams transfer context.

Measure the obligation; review exposure separately

1 Verify the terms

Same-client contract, dates, target, support window and pause rule.

2 Operate the case

Record actual response, resolution and customer-wait evidence.

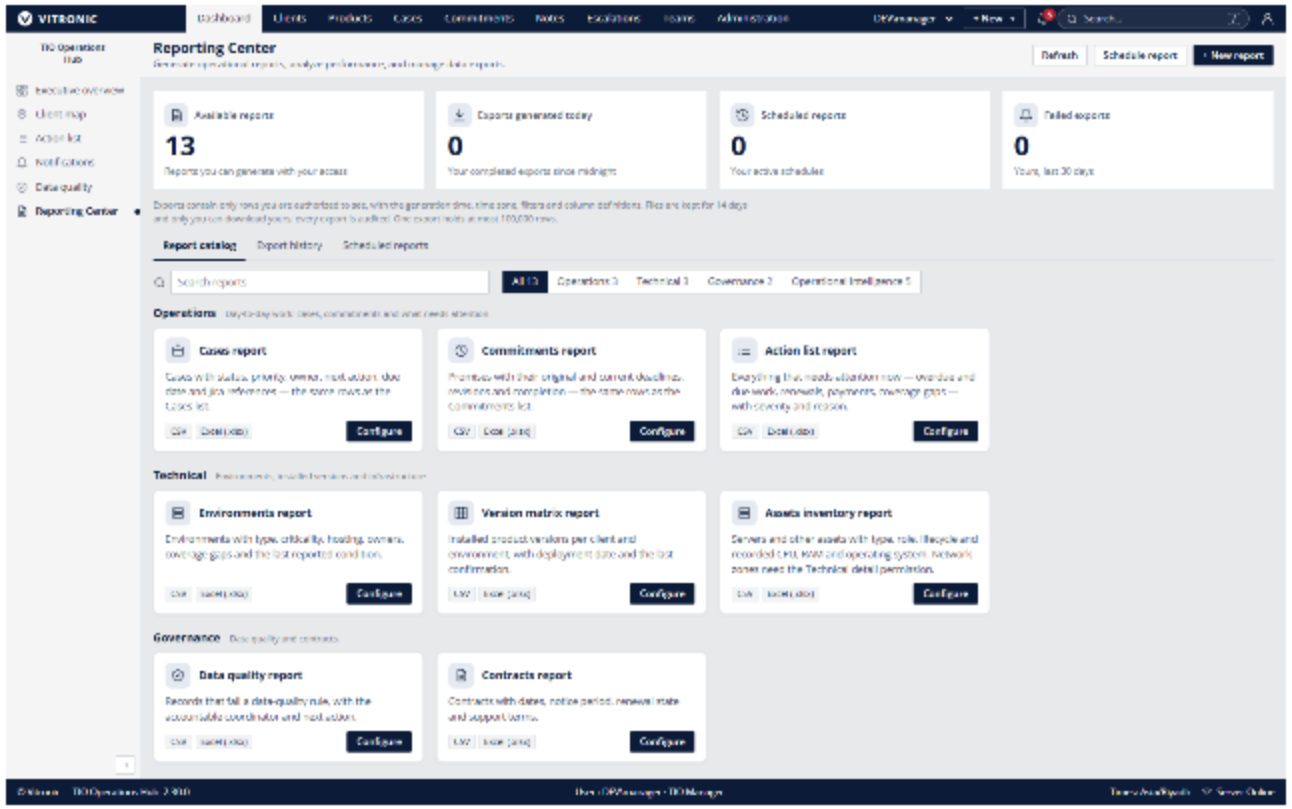

3 Reconcile candidates

Finance checks clause, term cohort, cap, corrections and approvals.

Rates exclude pending and not-measurable obligations; at-risk is a 24-hour warning.

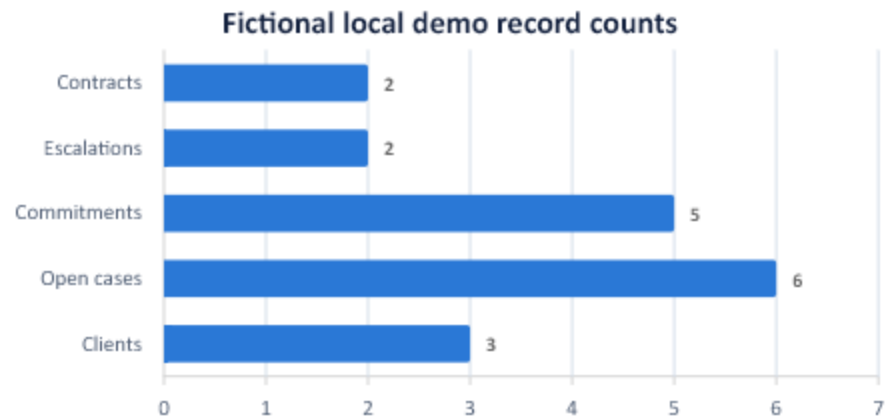

Assessments are indicative only. No invoice, payment, credit or accounting settlement.

Reporting Center

Preview, filter and export

Server-validated filters
Access-scoped preview
CSV and Excel exports
Export history and schedules
In-hub notifications

Example data only. No customer or performance claim.

A controlled application and data boundary

DOCUMENTED PRODUCTION SHAPE

IIS and ASP.NET Core

One web application serves the React interface and API.

SQL Server

Relational records, access data, audit and reporting metadata.

File storage

Attachments and exports need matching access and backup controls.

Release review

Match application and schema versions. DBA applies the reviewed script. Validate readiness, access, key workflows and recovery.

No hosted CI pipeline, tenant isolation, or safe horizontal scale-out is established by this design.

Pilot fit depends on operating readiness

A useful candidate can

Name record owners and review cadence
Approve a business visibility model
Operate the documented deployment
Agree measures and acceptance scenarios
Provide support, backup and recovery owners

Resolve before proposal

Identity and MFA requirements
Data locations and retention
Integration expectations
Assurance evidence and legal roles
Support hours, RPO and RTO

A product demonstration is not a deployment approval or a customer outcome.

Evaluate TIO Hub against real operating scenarios

Discovery

Identify the workflow and data boundary.

Fit review

Confirm identity, hosting, recovery and support.

Pilot definition

Agree users, measures, acceptance and exit.

Review the workflow against your operational requirements.

Product boundaries and approval requirements are recorded in the accompanying documentation.
