TIO Hub Privacy Notice - Deployment Drafting Template

TIO OPERATIONS HUB / CONTROLLED DOCUMENT

TIO-LEG-002 | 2.0 **ISSUED | 24 OCTOBER 2026**

Control field	Controlled value
Document ID	TIO-LEG-002
Version / status	2.0 / Non-publishable privacy drafting aid
Classification	Confidential legal/privacy working draft
Owner / approver	Privacy counsel and actual controller (required)
Issue date / review	24 October 2026 / Before deployment, processing change, or legal change
Source baseline	Product and operations records reviewed 24 October 2026
Supersedes	Initial privacy notice template dated 24 October 2026

> **Do not publish this template.** The controller, operator, jurisdiction, lawful basis, retention, locations, subprocessors, rights contacts and transfer safeguards are deployment-dependent and have not been provided. Privacy counsel must complete and approve the actual notice.

1. Controller, operator, and contact

For this deployment, the controller is `[legal entity, address, jurisdiction and contact]`. The service provider/operator acts as `[controller / processor / joint controller / other - counsel to determine]` under `[agreement/DPA]`. Privacy contact/DPO: `[ ]`. Supervisory authority: `[jurisdiction-specific]`.

2. People and data categories

Depending on deployment and user practice, the system may process:

- user account identifiers, names, work contact details, roles, authentication and access events;
- customer/client organization and business contact details;
- cases, escalations, commitments, contract references, handover notes and operational history;
- audit records, report filters, export metadata and in-app notifications;
- files and attachments uploaded by authorized users;
- technical environment, inventory, version, infrastructure and network details.

Confirm actual categories, sensitive/special data, children’s data, data subjects, source and mandatory/optional fields for the deployment. Do not assume every installation contains all categories. Users must not enter passwords, access tokens, private keys or connection strings into normal business records.

3. Purposes and lawful basis

The deployment may use information to maintain client/environment records, coordinate operational work, apply permissions, retain audit/event history, generate access-scoped reports, support administration and protect the service. The controller must specify each purpose, applicable lawful basis, necessity, retention, data minimization and any customer instructions: `[counsel/controller to complete]`.

4. Recipients and disclosures

Identify authorized users, customer administrators, hosting/database/file operators, support personnel, backup providers, identity providers, map tile providers and subprocessors. List legal disclosure basis and recipient categories. The documented application supports in-hub notifications and reports; it does not send email or synchronize Jira automatically. A map may cause a user's browser to request tiles from the configured provider; identify that provider, endpoint, attribution and applicable privacy information: `[deployment-specific]`.

5. Storage, security, and international transfers

Business records are stored in customer-managed SQL Server in the documented deployment model; attachments, exports and logs may be stored at configured file paths. Complete actual hosting, database, backup, access, encryption, key management, logging, locations and transfer safeguards. Do not claim encryption, data residency, a security certification or a specific safeguard without evidence for the exact installation.

6. Retention and deletion

The documented default for generated export files is 14 days, subject to deployment configuration. This is not the retention period for business records, audit history, backups, attachments or logs. Complete a category-based schedule stating retention trigger, owner, deletion method, exception/hold and backup expiry. Explain how deletion, legal holds and access requests affect restored backups: `[ ]`.

7. Individual rights and requests

Contact `[controller/rights contact]`. The controller determines applicable rights, identity verification, response deadlines, exceptions, complaint route and how requests affect audit history and backups under relevant law. Define routing and records of requests: `[ ]`.

8. Automated decisions and monitoring

Describe any profiling or decision-making with legal/significant effect: `[confirm none or specify]`. TIO Hub's documented SLA/penalty records support operational review and do not by themselves issue credits or payments. Confirm whether any local configuration introduces automated decisions beyond the documented baseline.

9. Changes and notice record

Notice version: `[ ]`; effective date: `[ ]`; prior version: `[ ]`; notification method for changes: `[ ]`; contact: `[ ]`. Privacy counsel must review legal references and translation for each jurisdiction.

10. Deployment completion checklist

Name controller/operator and DPO/contact; define users/data/categories/purposes/lawful basis; list recipients/subprocessors; verify locations and transfers; complete retention and deletion; explain rights handling; confirm security statements with evidence; assess map provider and browser disclosures; approve notice and version; link the notice from the actual sign-in or customer channel.

11. Revision history

Version	Date	Change	Approval
1.0	24 Oct 2026	Initial drafting template	Not approved
2.0	24 Oct 2026	Rebuilt with deployment completion matrix and privacy processing boundaries	Privacy counsel/controller approval required
